Dear Arsheen,

For the wellness sector, if they have budget, electric cryotherapy chamber is a good choice,
as it's comfortable, no risk, minimal staff involvement.

Like I explained, we offer two windchill options:
- indirect, with cold air blown onto the chamber's walls, or
- direct, with cold air blown on the client inside.
The windchill is adjustable from weak to intense.

Indirect windchill feels more comfortable and better suits wellness users. For athletes or physically active people who generally tolerate low temperatures better due to their faster metabolism, direct windchill is recommended.

Our electric chambers are powerful, industrial-grade systems that cool down quickly, within 30 minutes, and recover the working temperature between sessions within 5 to 10 minutes. Short intervals between sessions are ensured by the dual cooling panels on the ceiling and the chamber size. In smaller chambers, opening the door allows the warm air replace the cold air inside almost immediately, while a larger chamber helps keep the temperature more efficiently.

Here's a product sheet for our electric chamber:
e-IceChill Product Sheet _EN
The installation can be only done by us, it's more complicated than nitrogen-powered equipment. It costs 10,000 EUR.

Here's marketing materials:

Electric Cryochamber Brochure_PRINT_EN

Electric Cryochamber Outer Color Options_PRINT_EN

Cryomed_e-IceChill_specification_print_EN
e_IceChill_standard_dimensions_EN

Here's a video from a recent installation in Poland:
https://drive.google.com/file/d/1NO1cmI3iMdCdnQ4WBLohSjF4Fd_V-Rmk/view?usp=sharing

I'd like to stress that with our electric chambers there's no hidden costs or additional equipment, which is not disclosed before ordering.

The most important points:

1) Higher initial investment balanced by low session cost
The chamber's fully electric, no nitrogen needed. As the session cost is very low, after 2 to 3 years it becomes cheaper than the nitrogen chamber because while the initial price
of the nitrogen chamber is lower, the nitrogen cost accumulates over time and raises the overall investment and session cost.
Here's the session cost calculations for the electric chamber:
https://docs.google.com/spreadsheets/d/1txuvGv7xEn2_JFK9Ls0PT_N1-QdT4Fbq/edit?usp=sharing&ouid=109221503382114545139&rtpof=true&sd=true
On the average, it's less than 50 cents for one session.

2) Customization
We can make the door on the wider or narrower side, add a floor-to-ceiling window next to the door. The door can be fully glass and open to the right or to the left.
The panel color/material can be customized based on the interior design.

Here's photos of fully glass doors:
https://drive.google.com/drive/folders/1DTPjO6SGfBB06AjuDzadfYB7PCHKxkqo?usp=sharing

3) Dimensions and installation
The footprint in the standard configuration is 1.57x1.92 m. Inside, the chamber is 2.1m high, with the floor area of 1.4 mx1.65m. It's enough for two or three people.
There's also a cooling block that ideally needs to go outside, to the

ground or to the roof. The connecting cable is 30 m long but can also be
made up to 50 m long.
The block is L 1.1m x W 0.56m x H 1.31m. No additional equipment is
needed, no tech room, no water or sewer connection, no venting or special ventilation.

4) Specifications
The power connection: 380V/3 phases. Power consumption is max 8 kW, on
the average it's 3.5 kW. No other consumption.

5) The warranty is 2 years or 5 years in case of yearly inspections by us.

6) The lead time is 3 months.

For electric chambers, yearly maintenance is a must, but we can train your technicians to do it provided they have necessary qualifications.
Have a nice day,
Olena Sydorenko

Dear Arsheen,
It was a pleasure talking to you today.
As promised, I'm sending more detailed information on our open-top nitrogen cryotherapy equipment.

I'll send you separate letters on electric chambers and our business support and training.

So, normally, we offer 2 to maximum 3 options not to overwhelm the client.

Here's the questions we usually ask prospects to understand what would be better for them:
- How many people do they serve per day on the average?
- Space to be allocated for cryotherapy equipment: any limitations, like stairs at the entrance, no windows, no outer walls?
- The city/town they live in: how many people? Any local sports teams?

For the developing market like India, I'd advise nitrogen-powered cryosaunas in the first place, as they are more budget-friendly. Basic or Pro are usually the best choice for commercial use.

Another benefit of cryo sessions in open-top cabins is that they're well-tolerated by all age groups as the temperature range is adjustable between -110C and -170C.
Also, as the head stays out, the clients can keep the eye contact with the operator during the session and generally feel more comfortable as the head and neck are not exposed to extreme cold.

For you to have a better understanding of our product line, here's an overview of our open-top nitrogen cryosaunas.

We have bigger and higher models (2.5 sq.m, 2.45 cm high) that require assembly and come in three crates - Basic, Pro, Pro Ultra (you saw the latter in our showroom).
They take more nitrogen - 4.05 liters per a 3-minute session, but they can process up to 90 sessions per day and with back-to-back sessions, do not require mandatory
one-hour drying, so no downtime and very high performance. That's why we advise them for commercial use.
Another reason is that they are more convenient to use with Dewars

than smaller cryosaunas, like I showed to you, as the tank is easily rolled inside.

So, smaller models are great for smaller businesses, as well as for home use, as they come in one piece and do not require assembly - One, Mini (you saw this one on the call), One Ultra -
which take a bit more than 1 sq. meter (except One Ultra, which is a bit bigger) and come on one pallet.

One Ultra still requires assembly, though, but it's quicker than with Pro or Basic. All of these models take less nitrogen, 2.5 liters per session, but after 10-15 sessions they
need 1-hour drying (reheating). So, in case of commercial use, they are best if the customer flow is not very heavy, 20-25 people per day, up to 40 people, but no group bookings,
like 12 to 20 people at once, e.g. from sports teams.

Also, these models can be used with Dewars, but they are more convenient to use with pressurized tanks.
In your case, One Ultra can be an excellent choice for wellness centers with a moderate customer flow, 10 to 30 people per day

Then, there's a difference in component sets, minimal and upgraded:
 - Basic and Mini have the same component set and they have all necessary for good quality sessions;
 - One, One Ultra, Pro and Pro Ultra also have the same component set, but it's upgraded - 5 sensors instead of 3, an extra stop button for the customer, multimedia system, automatic elevator function.
All our machines have a one-click Wi-Fi connection for remote diagnostics and software updates.
Wi-Fi also allows business owners to receive daily reports about the number of sessions to their email, no need to check it onsite.

In more detail, you can see the difference here, in the comparison table: Cryosauna Comparison Table_EN

Here are product sheets for our cryosaunas:

Mini Product Sheet _EN
One Product Sheet _EN One Ultra Product Sheet _EN
Basic Product Sheet _EN
Pro Product Sheet _EN
Pro Ultra Product Sheet _EN
In our YouTube channel, there's a playlist with videos of various equipment:

The options for our open-top cryosaunas: Cryosauna Options_EN
A cover with a collar and gloves (500 EUR) is always something to recommend, as they help to cool the upper body better, but also save nitrogen.
It's especially recommended for athletes or physically active people.

A look book, to visualize color combinations: Cryomed Optional Colors Lookbook
Standard colors for outer shell are black, white, grey. Standard colors for the upholstery are grey, black, blue. If you want an optional color, it's 500 EUR for outer shell, 500 for upholstery.
But in fiberglass models (Pro Ultra, One Ultra) any outer shell color is free of charge.

The lead time for open-top machines is 2 to 4 weeks for standard colors, 4 to 8 weeks for non-standard colors.
Often, we have at least one unit of each model in stock, usually in white with blue upholstery.

For fiberglass machines, Pro Ultra and One Ultra, it's 3 months. Usually, we don't have them in stock.

Cryosaunas that needs assembly are easy to put together by any person with technical skills. We provide a manual and video instructions.

Usually, physical replacement of components is not needed earlier than 5th or 6th year, the majority of issues can be fixed remotely

online
by our team who can see the logs. Otherwise, repairs can be done by any person with general technical or electrical skills, depending on the component to be replaced,
following our instructions. No regular maintenance needed, though if you have a technical team you can offer this as an extra service.

After your sales team read through the info, we can schedule another call to answer their questions.

Have a a productive day,
Olena Sydorenko
